Safe AI for learning

Agent Behaviour Policies that help students learn, not skip the work.

1 The problem in schools

- Schools do not want AI doing students' work for them.
- If AI writes the essay, the student does not learn.
- That defeats the point of being at school.

2 The wider risk

- Young people means anyone under 18.
- The web holds useful sites and harmful ones, such as criminal or explicit content.
- Harmful content can affect focus, mood and wellbeing.
- AI opens a faster route to all of it.

3 Our solution

- An AI built for the school, which follows the school's own rules.
- **RiskMandate.ai** supplies the Agent Behaviour Policies (ABP) technology.
- The school, institution or government sets the boundaries.

4 How it works

Boundaries are written in plain language, then applied to every request.

DEFINE

Set the rules

Staff describe each agent's limits to an LLM, such as Claude.

→

ENFORCE

Apply the policy

ABP holds every agent to those limits, on every request.

→

LEARN

Work within limits

Students research and plan with AI, then write it themselves.

5 What agents can do

- Search approved websites only.
- Help research a topic, such as geography.
- Write notes in bullet points.
- Suggest a structure set by the exam board or school.

6 What is off limits

- Write the essay for the student.
- Open websites the school has blocked.
- Use structures the class has not been taught.

7 Aligned with teaching

- Output matches what is taught in class.
- It never contradicts learning objectives or lesson plans.
- Teachers stay in control of how students learn.

8 Beyond the classroom

- Works for children from age 5 upwards.
- Young people use AI within safe limits.
- Governments can set limits, not only schools.

9 The opportunity

Take ABP beyond cybersecurity and corporate use, into education and child safety.

AI that helps young people learn, and keeps them safe while they do.

ABOUT THIS BRIEF

Prepared for **Dinis Cruz**, team leader.
Technology by **RiskMandate.ai**.
Boundaries set by **schools and governments**.

Fair and safe by design

Who sets the rules, and how we keep them equal for every child.

1 Who sets the boundaries

- **RiskMandate.ai** designs the technology.
- **Schools** and institutions set rules for their own students.
- **Governments** can set wider limits for all young people.

2 No single gatekeeper

- No one person should hold all the power.
- Boundaries need wide consensus.
- Decisions are made by vote, not by decree.

3 Limits that fit the age

YOUNGER CHILDREN
Tight limits on sites and content, from age 5.

TEENAGERS
Wider research access, with harmful sites still blocked.

SCHOOLS
Subject agents that support coursework, not replace it.

4 How rules are agreed

Every boundary passes through a fair and open process.

PROPOSE
Draft the rules
Schools or government bodies suggest boundaries.

→

VOTE
Reach consensus
Stakeholders vote, so no one group decides alone.

→

APPLY
Enforce with ABP
Agreed rules go live for every student equally.

→

REVIEW
Check and update
Rules are reviewed often for bias and gaps.

5 Fair by design

- Rules must be free from bias towards any group.
- The same standards apply to every student.
- Decisions are open to scrutiny.

6 Equal access

- Private school students get no better information.
- No school gets agents that write essays for students.
- State and private schools share one standard.

7 What this protects

- Real learning, done by the student.
- Children's focus, mood and wellbeing.
- Trust between schools, parents and students.

8 Next steps

- Scope a pilot with one school or trust.
- Build a first agent, such as geography research.
- Test the boundaries with teachers and students.
- Agree a fair process for setting rules.

9 Our promise

One technology, with boundaries set fairly and applied equally to every child.

A safe way for young people to use AI, and a fair one for every school.
