WEB SUMMIT 2026 · JOSE'S CONDUCTOR BRIEF

# Vote before 13:00; three decisions: the keys, the enum key, the helper's model

5 November 2026, 07:25 UTC (scheduled wake; since brief 7, 4 November 17:25 UTC) · conductor@web-summit.jose

> Overnight: run logging (WS-160) for all your agents, run sheets for your two demos, QR codes on your meet page and brief, your issues tidied, and the watcher on the whole team. Before 13:00, Dinis's conductor asks everyone to vote on the stickers, which also tests the signed-ballot flow.

| 13:00 | 3 | 3 of 8 | 2,067 |
|---|---|---|---|
| the sticker vote, and your stand-up item | asks | your agents measured by the accountant | page views drained (most of them an automated sweep) |

## For you to decide

1 🗣️ **Decide: how the observability vault keys travel (WS-154, with WS-156)**
Your condition: the receiving conductor's person key; but Dinis's (sha256:c7ec751484fbf03d) is held by his conductor too (WS-138). Security's WS-156: a custodian instead. I hold the keys (and you do); none moves until you say. Details: board WS-154, WS-156.

- [ ] keep them held
- [ ] seal to Dinis's person key
- [ ] seal to the custodian WS-156 names, once it is named

Conductor's recommendation: Keep them held until WS-156 names the custodian, then seal to it.

2 ✅ **Approve: the enum key for WS-74's pending-count note**
automation@ built an n8n flow that tells you how many feedback answers wait (998e857); it needs the lane's enum key, a secret, kept in n8n.

- [ ] give n8n the enum key
- [ ] the vault agent counts on its runs and reports it; n8n never holds the key

Conductor's recommendation: The vault agent counts: it already drains that lane twice a day, so the key stays where it is.

3 ✅ **Approve: the accountant's first recommendation, the helper to Sonnet**
The helper's ledger: 1 run, 142,884 tokens without cache reads, pass, Opus. Only 3 of 8 agents measured yet (people/jose/accountant/).

- [ ] yes, the helper to Sonnet now
- [ ] wait for more runs

Conductor's recommendation: Yes: routine work, and your reviewer still checks every push. You change it in the helper's session.

## Due today for you (from the board)

- WS-159 (the sticker vote): vote in your browser with your site key before 13:00, and drain the votes (you are one of four drainers); /stickers/vote/.
- WS-154: your decision on the keys (ask 1).
- WS-37: the end-to-end test of the page views with Angelo; announcing them waits on security's review.
- WS-160: your agents log from their next runs (I already do); I record each on the issue once its first signed run shows.
- WS-74: your word on the enum key (ask 2).

## Blockers

- WS-37: security@web-summit.dinis's review of the page views (asked in 45e4b6e).
- WS-108: only your own phone check (open both apps, scan both codes).

## FYI

- 13:00: your item proposing 15 site and UI issues to Angelo's and Dinis's dev agents; WS-129 and WS-34 still wait for Dinis and Angelo.
- Dinis's conductor asks you to compare its observability page (/observability/) with yours and say what to keep from each (f47e088).
- An automated sweep of the command centres from 03:05 to 05:08 (over 1,400 views, almost all webdriver); 59 failed signatures, all from automated browsers.
- observability@web-summit.dinis sealed its observability vault key to your site key (89c5b9b); I can read it too, because I hold that key's private half (WS-138).
- Filed for their owners: WS-161 (a gate check on duplicate issue numbers) and WS-162 (agent-log.mjs needs NODE_USE_ENV_PROXY=1 in a cloud session).
- No new mentor note since 4 November 15:41; the watcher made no commit at 07:15.

## Next

- 12:20 run: record your 13:00 words; the agents' first WS-160 runs on the issue.

## Where this came from
